Air Toxics "Hot Spots" Information and Assessment Act of 1987

2000 ANNUAL REPORT

Prepared By: Air Toxics Section
Engineering Division

I. Introduction

The Air Toxics "Hot Spots" Information and Assessment Act (the "Hot Spots" Act) was originally adopted in September 1987. Several additions and modifications to the "Hot Spots" Act have been adopted since 1987. This report describes the "Hot Spots" program as it is currently being implemented.

The primary purpose of the "Hot Spots" Act is to notify the public of facilities that have routine and predictable emissions of toxic air pollutants that may pose a significant health risk to nearby residents and workers. The Act also encourages those facilities to reduce the health risk below the level of significance.

II. Ventura County APCD "Hot Spots" Program

The District's "Hot Spots" program consists of several steps. The first step is to identify facilities that may have routine and predictable emissions of toxic air pollutants. Since adoption of the "Hot Spots" Act in 1987, several methods have been used to select the facilities subject to the program. Initially, facilities with emissions of more than 10 tons per year of the pollutants traditionally regulated by the District - organic gases, nitrogen oxides, sulfur oxides, and particulate matter - were subject to the "Hot Spots" program. Later, other facilities were included in the program based on specific processes used at the facility (e.g., chrome plating), the amounts of specific compounds emitted at the facility (e.g., >1000 pounds per year of styrene), or the Standard Industrial Classification (SIC) Code of the facility (e.g., 5511 - auto body shops).

These facilities are then required to prepare emission inventories using criteria and guidelines that have been developed by the California Air Resources Board. The completed emission inventories are reviewed and approved by District staff. Every four years, District staff review information submitted by each facility to determine if the emission inventory should be updated.

When an emission inventory is completed, District staff analyze the information and prioritize the facilities as having a high, intermediate or low probability of causing a health risk. During the prioritization analysis, a numerical score is calculated for each facility based on the amount of emissions from the facility, the toxic potency of the emitted compounds, and the distance from the emission point to a receptor. Additionally, for a facility that completed a health risk assessment based on an earlier inventory, the results of the previous health risk assessment may be used in determining the priority for the facility.

High priority facilities are required to prepare a health risk assessment. Intermediate priority facilities are exempt from further program requirements until the next four-year cycle begins. Low priority facilities are exempt from any further requirements unless new information becomes available that suggests the need to re-evaluate a facility.

Appendix A lists the facilities that are currently in the "Hot Spots" program and the current priority for each facility. Facilities that are listed with a "low" priority will be exempted from the program when the California Air Resources Board approves the District request to exempt them.

The high priority facilities must prepare the health risk assessments according to methods developed by the state Office of Environmental Health Hazard Assessment (OEHHA). The health risk assessments are reviewed and approved by both District staff and OEHHA staff.

If the health risk assessment indicates that the facility may pose a significant health risk, the facility must notify the affected public of the risk. If the health risk assessment indicates that the facility does not pose a significant health risk, the facility does not need to take any further action. The information may be used to re-prioritize the facility to reduce the future program requirements.

For Ventura County, a significant health risk for purposes of providing public notice under the “Hot Spots” program has been defined as a lifetime excess cancer risk of greater than or equal to 10 in a million or an acute or chronic noncancer total hazard index exceeding 1.

Appendix B lists the results of all health risk assessments that have been submitted to the District to date.

When public notice is required, the District prepares a letter describing the risk for distribution to affected residents and businesses. The facility may also prepare a letter of its own to include in the notification. Upon request of the letter recipients, the District and the facility will hold a public meeting to respond to public concerns.

Finally, facilities that may pose a significant health risk to nearby residents or workers are required to develop and implement a plan to reduce the health risk below the level of significance. All of the facilities in Ventura County that have been determined to create a significant risk through the “Hot Spots” program have made progress in reducing the risks, in most cases to below the significant risk level.

Appendix C lists the facilities that have been found to have a significant potential health risk. All the facilities on the list have provided public notice. In addition, Appendix C describes the progress of these significant risk facilities in reducing their risks.

III. Industrywide Facilities

In addition to the procedures described above that apply to individual facilities, the District staff are responsible for analyzing the potential health risk posed by certain classes of smaller facilities that are called “industrywide” facilities. Facilities that will be included in industrywide assessments by the District are autobody shops, retail gasoline stations, dry cleaners, and gasoline bulk plants.

Statewide efforts have been completed to develop guidelines for preparing industrywide air toxics inventories and health risk assessments for autobody shops (completed September, 1996) and retail gasoline stations (completed December, 1997). It is expected that much of the information in the gasoline station guidelines can be applied to gasoline bulk plants. The guidelines for dry cleaners are nearly complete.

Industrywide facilities are prioritized in a manner similar to that used for other facilities, using the statewide guidelines. The District has been prioritizing autobody shops and gasoline stations using these guidelines. These types of facilities can potentially cause significant risk. So far, 87 of 101 autobody shops and 109 of 200 gas stations have been determined to be low or intermediate priority. A more in depth review of the unprioritized facilities is in progress. One reason many autobody shops and gasoline stations in Ventura County are less than high priority

is due to existing District Rules. APCD Rule 74.18 requires most automotive painting to be performed in a paint spray booth, requires high transfer efficiency coating application methods to be used, and prohibits use of coatings containing lead or hexavalent chromium from being applied outside a spray booth. APCD Rule 70 requires gasoline stations to use Phase I and Phase II vapor recovery systems and requires that vent pipes on gasoline tanks to be equipped with pressure vacuum valves.

IV. Air Toxics Rules

No specific rules to control emissions of air toxics have been adopted by the District based on the Air Toxics "Hot Spots" data.

The California Air Resources Board uses the Air Toxics "Hot Spots" data in developing air toxic control measures (ATCM) under the Toxic Air Contaminant Identification and Control Program. The US Environmental Protection Agency is also using the toxics emission data in developing Maximum Achievable Control Technology (MACT) standards under Title III of the 1990 Clean Air Act Amendments.

The District is required under state law to implement and enforce both state ATCM's and federal MACT standards. ATCM's which have gone into effect recently include controls on degreasers using halogenated solvents and chrome plating facilities.

Air Toxics "Hot Spots" Program (AB 2588)

Cancer Risk is expressed as lifetime excess cancer risk in chances per million.

HI is the hazard index, which is the ratio of the concentration to the reference exposure level.

Approved health risk assessments have been approved by the District. These results were reviewed by the Cal EPA Office of Environmental Health Hazard Assessment, as applicable.

Results for Health Risk Assessments that are under review are based on results submitted by the facility operator and have not been approved by the District.

Air Toxics “Hot Spots” Program (AB 2588)

Risk Reductions by Significant Risk Facilities

Fac #	Facility Name	Location	Area	Year	Cancer Risk	Chronic HI	Acute HI
01040	California Air National Guard Public Notice in progress.	100 Mulcahey Drive	Port Hueneme	1993	19		52
	Acute risk was driven by acrolein from engine testing. Reconfiguration and control options are being explored to reduce risk. Cancer risk was significant only at unoccupied location.						
01169	Coastal Multichrome Public Notice completed.	1100 Mercantile Street	Oxnard	1991	133	0.6	0.4
	Risk was driven by perchloroethylene degreasing solvent and hexavalent chromium from plating. Use of perchloroethylene has been eliminated. Application was submitted for relocation and additional controls on the chrome plating.						
00129	GE Plastics (currently owned by Polycom Huntsman) Public Notice completed. Community held.	1000 Factory Lane	Oxnard	1991	161	0.4	0
	Risk was driven by acrylonitrile emissions from resin transfer. Facility has reduced use of resin. Permit to Operate revised to require risk reduction measures prior to any future increase in resin use. .						
01137	Oxnard Wastewater Plant Public Notice completed.	6001 South Perkins Road	Oxnard	1990	8	0.8	1
	Risk driven by acrolein and formaldehyde from gas fired engines, and hydrogen sulfide from the headworks. Reconfigured stacks on the engines to improve dispersion and reduce risk to below significance level.						
01137	Oxnard Wastewater Plant Public Notice in progress.	6001 South Perkins Road	Oxnard	1992	7	0.7	2
	Risk driven by acrolein from gas fired engines, and chlorine and ammonia from the headworks. Some gas fired engines have been removed or placed on standby status and replaced with electric motors. Headworks odor control system chemical use changed to eliminate chlorine emissions. A new health risk assessment is in progress..						
00146	Reichhold Chemicals (currently owned by Cook Composites and Polymers) Public Notice completed.	5980 Arcturus Avenue	Oxnard	1989	350	0.3	7
	Risk was driven by methylene chloride emissions from fire retardant resin bromination. Product and use of methylene chloride eliminated.						
00146	Reichhold Chemicals (currently owned by Cook Composites and Polymers) Public Notice completed.	5980 Arcturus Avenue	Oxnard	1991	0	0.08	2
	A new health risk assessment is in progress.						

00997	US Navy-NAWS	NAWS Pt Mugu	Point Mugu	1990	11	0.07	0.07
	Public Notice completed. Community meeting held.						
	Risk driven by hexavalent chromium in paints used in the auto hobby shop. Source has stated that chromate paints are no longer allowed in the auto hobby shop. A new health risk assessment is under review.						
01006	US Navy-NCBC	NCBC	Port Hueneme	1990	123	0.8	1
	Public Notice completed. Community meeting held.						
	Risk was driven by hexavalent chromium from unconfined abrasive blasting. The abrasive blasting operation was enclosed and controlled. A new health risk assessment demonstrating that risk has been reduced to below the significance level has been completed and approved.						
00347	Santa Fe Energy	Hobson B & C Leases- Rincon	Ventura	1989	55	0.03	0.002
	(currently owned by Vintage Petroleum-part of consolidated Rincon facility)						
	Public Notice completed.						
	Risk was driven by benzene emissions from a centrifuge used to treat tank bottoms. The centrifuge was permanently removed from the facility.
